

AI use case registration

AI-enabled recruitment screening

PURPOSE OF THIS DOCUMENT

Agree the business need, the proposed AI system and its boundaries, so that the impact, risk and regulatory assessments that follow start from the same facts.

Document control	Detail
Organisation	Gulf Professional Services PJSC (fictional)
Use case ID	AI-UC-001
Business function	Human Resources
Lifecycle status	Proposed / pre-deployment
Business owner	Chief Human Resources Officer
Document owner	AI Governance Lead
Version and date	Version 1.0 16 September 2026
Information classification	Fictional case study (portfolio)
Prepared by	Tarunima Vijay

1. Organisation and operating context

Context field	Detail
Organisation overview	A UAE-headquartered professional-services firm with about 2,500 employees, hiring around 600 people a year across advisory, technology and corporate functions.
Business environment	The firm receives about 40,000 applications a year. A central recruitment team of 12 screens them, supported by hiring managers in each business unit.
Geographic context	Initial deployment is planned for the United Arab Emirates. Applicants may be located in other jurisdictions.
Relevant internal functions	Human Resources, Technology, Information Security, Privacy, Legal, Risk and Procurement.
External parties	Job applicants and the third-party recruitment technology provider.
Context caveat	Exact legal obligations must be confirmed for the organisation, sector, deployment location, data location and applicant population.

2. Business need and intended outcome

Field	Registration statement
-------	------------------------

Current challenge	Recruiters screen every application by hand. First-stage screening takes about 10 working days per role, and recruiters prioritise similar CVs differently.
Business objective	Improve the speed and consistency of initial CV review while preserving human accountability for employment decisions.
Intended outcome	Provide recruiters with a prioritised list of applicants for further human review.
Success indicators	Screening turnaround, CV extraction accuracy, recruiter override rate, candidate complaints and selection rates across applicant groups. Thresholds will be agreed before any pilot.
Non-objective	The system is not intended to make autonomous hiring, rejection, promotion or termination decisions.

3. AI system overview

Field	Registered description
Use case name	AI-enabled recruitment screening
System type	A third-party, cloud-hosted AI tool connected to the firm's applicant-tracking system (ATS).
Primary users	Recruiters; hiring managers may view recommendations.
Affected stakeholders	External job applicants and employees applying for internal roles.
Inputs	CVs, application responses, job descriptions, role criteria, qualifications, skills and employment history.
Processing	The system extracts candidate information and compares it with predefined role-related criteria.
Outputs	Candidate scores, rankings, extracted attributes and shortlisting recommendations.
Decision role	Decision support. An authorised human recruiter makes the final decision.
Human intervention	Recruiters review the original CV, can challenge or override the ranking, and record the reason for their final decision.
Provider	To be confirmed during vendor due diligence.
Data location and retention	To be confirmed before approval.
Deployment status	Proposed; not approved for production use.

4. Expected value and potential impact

Expected value	Potential governance impact
Faster initial screening	Faster screening must not come at the cost of accuracy or real human review.
More consistent prioritisation	Consistency may reproduce unsuitable criteria or historical patterns at scale.
Reduced manual workload	Recruiters may over-rely on scores or rankings.

Improved candidate matching	Incorrect extraction or scoring may disadvantage qualified applicants.
-----------------------------	--

5. Initial governance triage

PRELIMINARY TRIAGE RESULT

Enhanced governance review required before deployment, because the system will influence which applicants are considered for a job. This is a triage outcome, not a legal classification or an approval.

Triage area	Initial observation	Follow-on assessment
Fairness	Ranking may create unequal outcomes or use proxy variables.	AI impact assessment and fairness testing
Privacy	CVs contain personal information and may reveal sensitive information.	Privacy and data-governance assessment
Transparency	Applicants and reviewers need appropriate information about AI use and limitations.	Transparency and communication review
Human oversight	Human review must be effective, not a rubber stamp.	Oversight design and operating procedure
Accuracy and robustness	Extraction, scoring and ranking errors may affect candidates.	Independent validation and monitoring plan
Third party	Provider controls, data use and model changes are not yet evidenced.	Vendor due diligence and contracting
Regulatory scope	Recruitment AI is high-risk under the EU AI Act where that Act applies, and UAE data protection law covers applicant data.	Legal and regulatory applicability assessment

6. Boundaries and assumptions

Category	Recorded boundary or assumption
Included	CV parsing, candidate scoring, ranking, recommendations, recruiter review and initial monitoring.
Excluded	Job advertising, video-interview analysis, emotion recognition, autonomous rejection, performance monitoring and employee termination.
Key assumption	The ranking decides which applications a recruiter looks at first, and in practice which ones are looked at at all.
Decision boundary	The AI advises; authorised humans decide and remain accountable.
Evidence status	No vendor documentation, data samples, validation results or contracts have yet been reviewed.
Reassessment triggers	Material model or data change, new jurisdiction, new decision purpose, incident, complaint, a drop in performance or a control failure.

7. Required approvals and next action

Role	Registration responsibility	Status
Business owner	Confirms business need, intended use and accountability.	Pending
AI Governance Lead	Confirms inventory entry and routes the use case for assessment.	Pending
Privacy / Legal	Reviews personal-data and legal applicability.	Pending
Information Security	Reviews security, access and third-party technology risk.	Pending
Procurement	Completes vendor due diligence and required terms.	Pending

NEXT GOVERNANCE ARTEFACT

Document 2, the AI Impact Assessment, builds on the facts agreed here. Detailed control design waits until the scope and system boundary are confirmed.

8. Portfolio and confidentiality note

This is a fictional case study I prepared for my AI governance portfolio. It contains no client information and does not use any client's or employer's templates or methods. The organisation, facts and judgements are invented for demonstration.

It is not legal advice, an ISO/IEC 42001 certification assessment or a production approval. The detailed impact, risk and regulatory work is in the documents that follow.
